

Exterior Volumetry

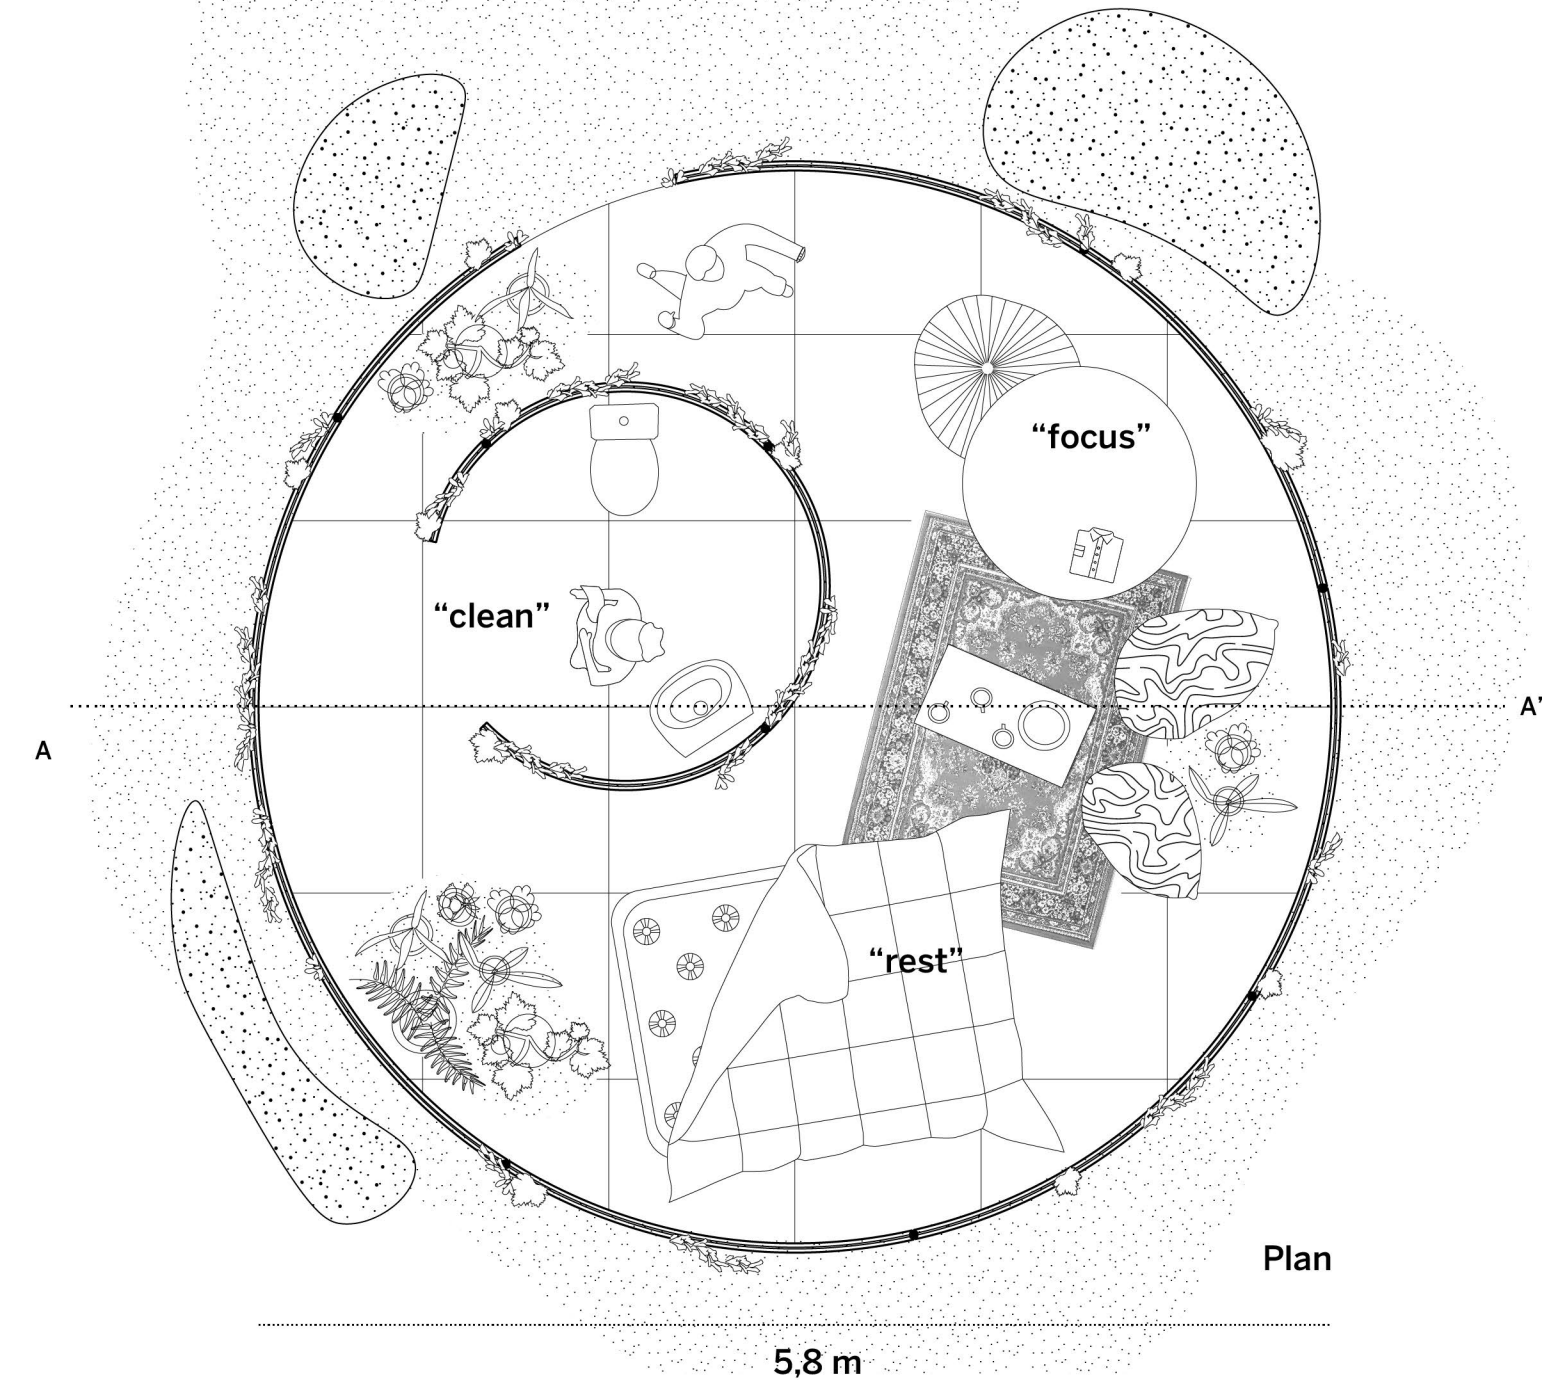

CORN CRIB

A corncrib is a ventilated bin for storing unhusked ears of corn.

Due to the modernization of the agricultural infrastructures, the corncribs have become obsolete and therefore useless. The rural landscape is populated by these empty metal structures.

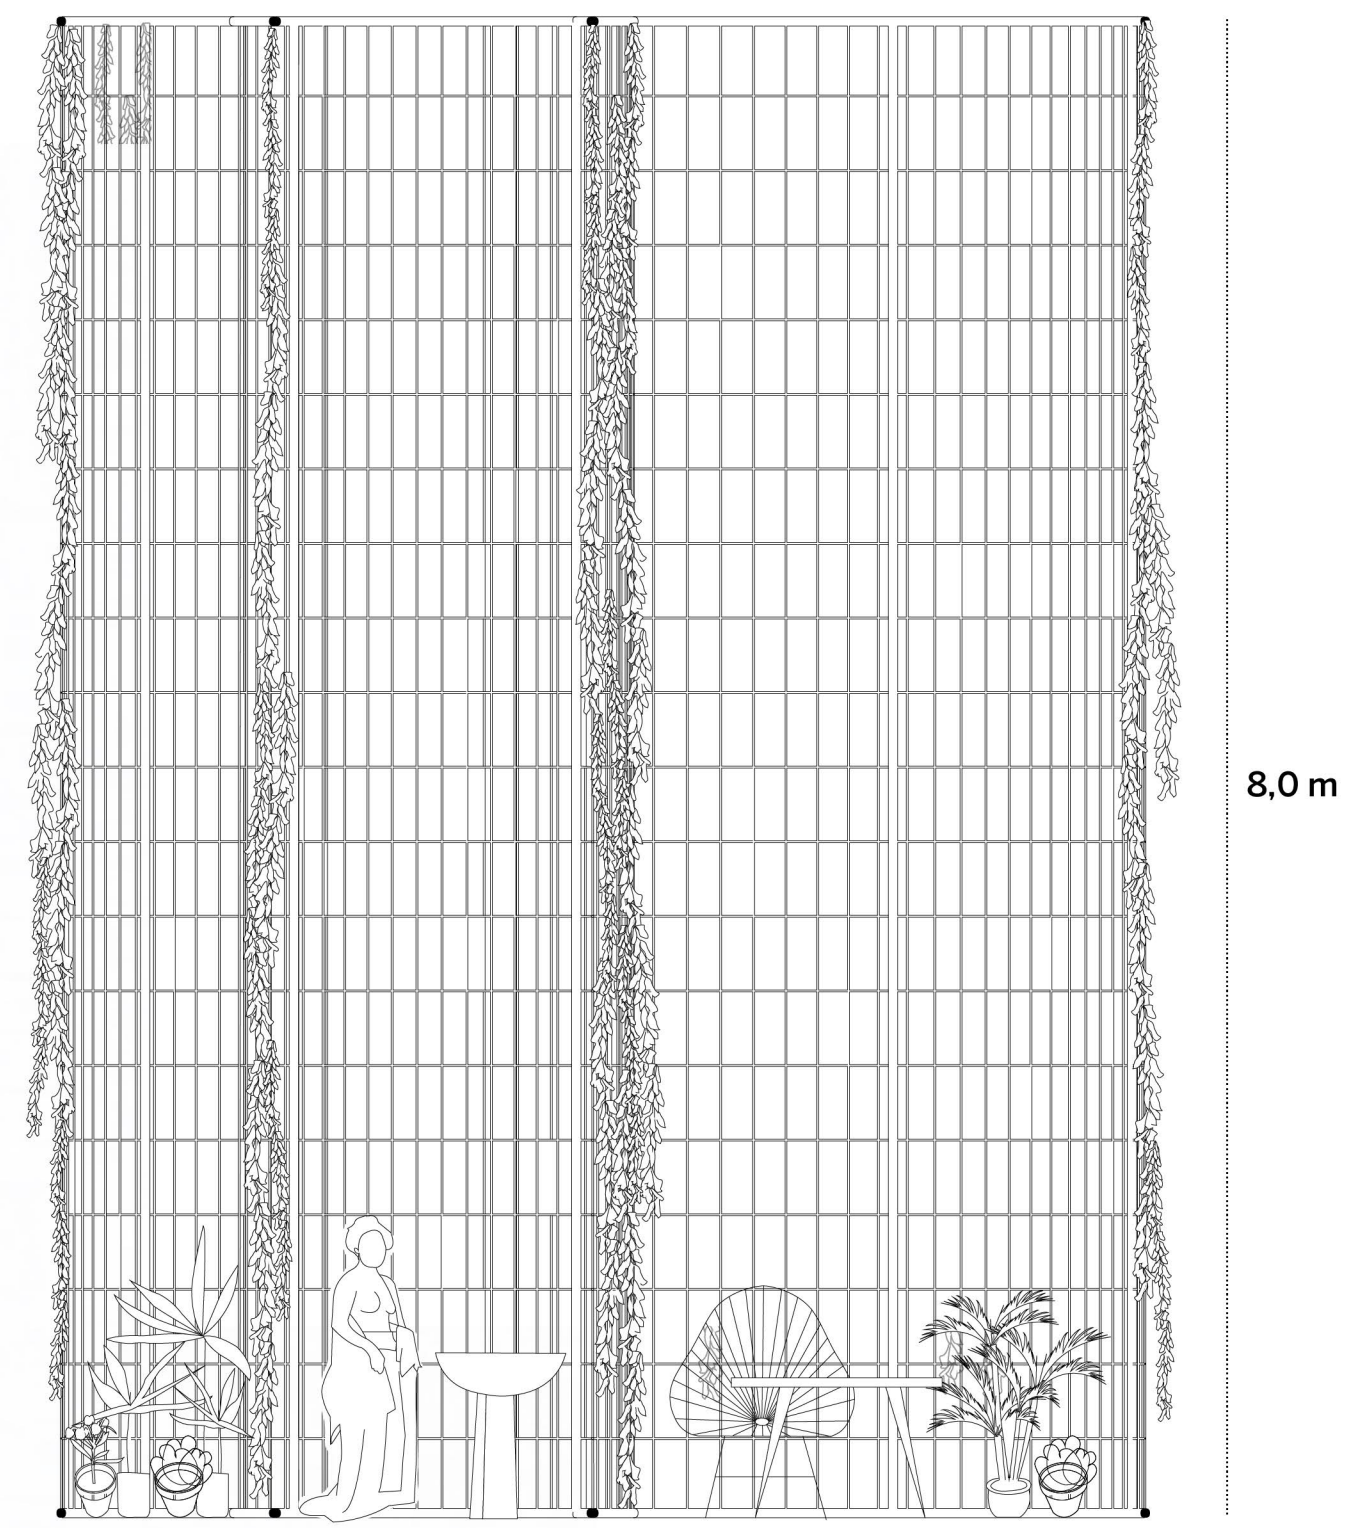

We appropriate these elements to inhabit them through a natural process of plant growth that will vary throughout the seasons generating different degrees of privacy.

This way, we give a second use to an existing structure, composing a discrete house integrated in the landscape.
